

HonorHealth Rehabilitation Hospital: Scope of Services

HonorHealth Rehabilitation Hospital is committed to providing the highest level of safe, quality care to all those we serve. Our teams of medical rehabilitation specialists deliver carefully coordinated, comprehensive treatment to advance individual recovery. We embrace industry-recognized standards of excellence and strive for continuous quality improvement to optimize patient outcomes. These efforts have helped us earn the trust of patients, families and colleagues across our communities.

At our 50-bed hospital, located in central Scottsdale, Arizona, we offer highly integrated programs of care to treat patients' complex medical rehabilitation needs.

HonorHealth Rehabilitation Hospital is accredited by The Joint Commission and the Commission on Accreditation of Rehabilitation Facilities (CARF) for comprehensive integrated inpatient rehabilitation and our stroke, brain injury and amputation specialty programs.

WHO WE SERVE

Patient profile. Comprehensive inpatient rehabilitation services are provided to individuals 18 years and older who have experienced an injury or illness that had resulted in the loss of function (abilities) in activities of daily living (ADLs), mobility, cognition and/or communication.

Diagnoses treated. Our patients' diagnoses include, but are not limited to stroke, brain injury, spinal cord injury, neurological diseases (e.g., multiple sclerosis, ALS, polyneuropathy, Guillain-Barré syndrome, motor neuron disease), amputation, orthopedic injuries, including complex fractures and joint replacement, major multiple trauma, cardiac conditions, and cancer. Patients who are ventilator-dependent are not eligible for admission.

Admission guidelines. To be considered for admission, patients must be medically stable yet still require care by rehabilitation physicians and nurses. They must also have physical and/or functional needs that require highly coordinated physical, occupational and/or speech therapies and the capacity to benefit from such services.

Patients are admitted without regard to race, color, religion, ethnicity, gender identity/expression, sexual orientation, marital status, mental or physical disability, veteran or military status, creed and/or national origin. Our team works to ensure that individualized care is based on each patient's cultural and language preference, gender/gender identity and ability to learn.

Patients who do not meet our hospital's admission criteria include those who are under the age of 18; actively require psychiatric services; present with behavioral limitations that pose an imminent risk to themselves or others and/or limit participating in an acute rehabilitation program; or have medical needs beyond the scope of services offered.

Referrals. Referrals for admission are accepted from private physicians, hospitals, other post-acute providers, insurance companies and agencies serving persons with disabilities. Patients may be admitted from a hospital, surgery center, clinic, skilled nursing and long-term care facilities, as well as from home.

Insurance. Our hospital participates with Medicare, Medicaid and most managed care plans, as well as workers' compensation, no-fault and other insurance providers. Fee schedules are available upon request.

ASSESSING PATIENT NEEDS

All patients are evaluated prior to admission to determine their potential to participate in and benefit from inpatient rehabilitation. This includes a review of their medical, physical and cognitive condition, previous and current levels of function, and psychosocial and cultural background.

Once admitted, patients are assessed by the rehabilitation team – including a physiatrist (a doctor specializing in physical medicine and rehabilitation); nurses; physical, occupational and, if indicated, speech therapists; dietitians and case managers. A behavioral assessment may also be conducted, if warranted. The team will then work with the patient to establish goals and tailor treatment to address impairments in mobility, self-care, speech, cognition and other areas. This plan is documented to guide care delivery, monitor improvement and is modified as needed.

Special needs. Our hospital also accommodates patients requiring special care needs, including colostomy care, gastrointestinal (PEG) feeding tubes, halo devices and external fixators, indwelling catheter, intravenous lines (e.g., PICC lines, Hickman and Broviac catheters, ongoing IV therapy), LVADs, Lifestest, nasogastric (NG) tubes for feeding and hydration, negative pressure wound therapy, orthotic and prosthetic prescription and training, peritoneal dialysis, hemodialysis and tracheostomy tubes.

PROVISION OF CARE

Hours of service. Inpatient care is provided 24 hours a day, seven days per week, including on-site physician, nursing, respiratory therapy, pharmacy, laboratory and radiology services. Physical, occupational and speech therapies are available Monday through Friday from 8 a.m. to 4:30 p.m. and weekends from 8 a.m. to 3 p.m. Patients' schedules are established by the care team.

Rehabilitation team. The rehabilitation team is led by a physiatrist, a board-certified physician specializing in physical medicine and rehabilitation, and includes rehabilitation nurses, physical and occupational therapists, speech language pathologists, recreational therapists; respiratory therapists, dietitians, pharmacists, case managers/social workers, and other clinical, support and administrative staff.

A majority of our staff have advanced degrees and specialty certifications that enhance the delivery of expert care. This includes certified rehabilitation registered nurses (CRRN); board certified clinical specialists in neurologic physical therapy (NCS), geriatric physical therapy, vital stim, Lee Silverman Voice Treatment (LSVT) Loud and Big; certified brain injury specialists (CBIS), certified stroke rehabilitation Specialist (CSRS); certified fall prevention specialists (CFPS); certified neuro and neuro development technique trained therapists (IFRAH); medical rehabilitation management specialists (MRMC); assistive technology practitioners (ATP), seating and mobility specialists (SMS), vestibular certification, lymphedema certification and crisis prevention institute (CPI) specialists.

Staffing. Staffing is based on census, diagnosis, severity of injury/illness and intensity of services required by each patient, as well as by state practice guidelines for each discipline. Contract staff is available for coverage as needed.

Therapy schedules. The rehabilitation team sets each patient's treatment schedule. Patients are expected to participate in three combined hours of physical, occupational and/or speech therapy per day, five days per week. If unable to tolerate these hours due to certain medical issues (e.g., chemotherapy, radiation, dialysis) or other extenuating circumstances, they may engage in 15 hours of therapy over a seven-day period. On average, patients participate in over three hours of therapy each day, Monday through Friday and less on weekends.

Scope of treatment. We offer a wide range of evidenced-based treatments, advanced techniques and innovative technologies to help rebuild strength and skills, restore function and mobility, and maximize independence. This carefully coordinated, individualized approach guides patients toward their goals, including a safe and timely discharge to home or the next appropriate level of care.

Additional services. To best meet patients' complex needs, we offer additional or ancillary services, including but is not limited to nutritional guidance and dietary services, pharmacy services, respiratory therapy, diagnostic radiology, laboratory services and neuropsychology services when indicated. Chaplaincy services/pastoral care are arranged upon request.

Also available are prosthetic and orthotic services, wheelchair and mobility evaluations and vision assessments for patients with neuro-visual impairments. The interdisciplinary rehabilitation team helps determine and arrange for these services.

Role of family/support network. The involvement of family and caregivers is key to a patient's successful rehabilitation and safe discharge. The team will assess the family's ability and willingness to support and participate in the plan of care. Education, training and advocacy will be provided to help prepare them to meet the patient's needs going forward.

Practice guidelines. Our hospital follows the standards and guidelines established by federal, state, local and industry agencies, including the Centers for Medicare & Medicaid Services (CMS), Commission on Accreditation of Rehabilitation Facilities (CARF), The Joint Commission and national boards/associations of medicine, nursing, therapy, pharmacy and others.

EVALUATING AND DOCUMENTING PATIENT PROGRESS

Ongoing assessment of a patient's medical condition, progress and changing rehabilitation needs is documented through the individualized, interdisciplinary plan of care, progress notes, team conference report, discharge summary and the 90-day post-discharge follow-up call.

Patient Feedback. We gather patient feedback through patient/family conferences, education and training sessions, leadership rounding, patient satisfaction questionnaires (e-Rehab survey), 90-day post-discharge follow-up call and inpatient support groups. Also in place is a complaint/grievance process should any concerns arise.

Discharge planning. Returning a patient to home and/or the community is the goal of rehabilitation. Our case managers work closely with the patient, family and rehabilitation team to determine the most appropriate discharge setting. The planning process begins at the time of admission and continues throughout the patient's stay with Care Partner meetings, hands-on family training sessions and individual activities that support the successful transition from hospital to the next level of care.

As needed, therapists may provide an on-site or virtual home assessment to recommend modifications or special equipment that may help to ensure a safe discharge. The team will also assist in identifying vendors and other resources available.

OUR SPECIALIZED REHABILITATION PROGRAMS AND SERVICES

The guiding philosophy of all our programs and services is to provide comprehensive, compassionate care and advanced treatment to individuals with complex medical rehabilitation needs from the time of injury or illness through long-term community follow-up. Our goal is to maximize each patient's medical, physical, psychological, behavioral, cognitive, social, recreational and vocational potential and quality of life.

Spinal cord program

Our hospital provides a highly structured, carefully coordinated system of care for persons with spinal cord injury (SCI). This includes individuals with spinal dysfunction due to traumatic injury resulting from motor vehicle crashes, falls, acts of violence, sports or recreational activities, etc., or from a non-traumatic disease, such as cancer/tumors, infection, cervical stenosis and other degenerative conditions, congenital disorders, or surgery.

Patients with any level of non-traumatic spinal cord injury and completeness of spinal cord dysfunction may be accepted, as well as those with C6 and below traumatic spinal cord injury may be admitted to our program. Individuals on a ventilator are not accepted. Additional patient populations, including those with multiple sclerosis, Guillain-Barré syndrome and motor neuron disease, may also be considered for admission.

Our team of SCI specialists expertly addresses the wide range of patients' needs, including bladder, bowel and respiratory function, mobility, skin integrity, nutrition, cognition, and emotional, behavioral and sexual concerns and other issues/co-morbidities.

Stroke program

Our stroke rehabilitation program focuses on the often complex needs of individuals who have experienced an ischemic stroke (when blood flow to the brain is blocked), hemorrhagic stroke (bleeding in the brain), or transient ischemic attack (TIA or mini-stroke).

In addition to medical and nursing oversight, our experienced team of stroke/neuro rehabilitation specialists provide a range of physical, occupational, speech and cognitive therapies to improve recovery. This includes hands-on treatment and advanced technologies, such as videofluoroscopy and electrical stimulation to help diagnose and treat swallowing disorders; body-weight supported treadmill training (BWSTT) to improve gait performance and mobility; constraint induced movement therapy (CIMT), mirror therapy, RTI Functional Electrical Stimulation bicycles to strengthen motor function; robotic therapies -- Ekso exoskeleton and Armeo Spring Trainer and -- to help build new neural pathways; and prism adaptation treatment and Bioness Integrated Therapy System (BITS) to address visual impairments.

Brain injury program

Our inpatient brain injury rehabilitation program focuses on restoring the individual's strengths, skills and functional independence through advanced treatment, education, training and support. We also

serve as an important resource to brain injury providers, organizations and other entities both in our local communities and across the country.

Individuals may be admitted to this program with an acquired brain injury, including but not limited to traumatic, non-traumatic or anoxic brain injury, brain tumor or aneurysm.

Patients must also be assessed at Level II or higher on the standardized Ranchos Scale of cognitive functioning to be considered for admission.

Patients in a coma or persistent vegetative state who do not demonstrate a purposeful response to their surroundings are not appropriate candidates for admission, nor are individuals on a ventilator. Persons with concurrent spinal injury, fractures, cardiac issues and other conditions are considered for admission.

Amputation program

Focusing on post-surgical, prosthetic and community reintegration, our program advances the recovery for individuals with upper or lower extremity limb loss due to a traumatic injury or surgery resulting from vascular disease, diabetes, cancer, infection, excessive tissue damage, neuropathies or other conditions.

Our holistic, interdisciplinary approach assures proper wound care and limb management; increases an individual's strength, coordination and endurance and decreases pain. We introduce advances in orthotic/prosthetic designs, make adjustments to current devices, offer guidance to meet changing lifestyle needs and provide access to a variety of resources. We also train individuals on the use and maintenance of their device; help to avoid secondary complications and facilitate the transition to life ahead.

Orthopedic program

Individuals who have undergone joint replacement, experienced a musculoskeletal injury, sustained bone trauma or have been diagnosed with a degenerative joint disease may be candidates for this specialized orthopedic rehabilitation program. Treatment is tailored to individual needs to build strength and endurance, restore physical function and mobility, minimize pain and avoid complications.

Among the range of treatments offered are electrical stimulation, treadmill training, assistive equipment and technologies, advanced pain management, including pharmacological intervention and therapeutic taping, as appropriate.

Neurological program

Our hospital's neurorehabilitation program offers coordinated, interdisciplinary care for individuals with multiple sclerosis (MS), Guillain-Barré syndrome, critical illness myopathy and other neurological diseases. Treatment is tailored to address acute or changing needs related to balance, strength, endurance, mobility, cognition, communication, swallowing, bowel/bladder function, vision, self-care and participation in activities of daily living.

The rehabilitation team includes LSVT Loud and Big and neuro certified specialists, psychologists, wheelchair seating and assistive technology practitioners and cognitive rehabilitation specialists.

Medically complex program

Our hospital provides an interdisciplinary program of care to meet the needs of individuals of individuals following organ transplantation, infections, pulmonary disease, post-COVID and other complex medical issues. This program addresses the scope of the patient's rehabilitation needs, including strength, endurance, mobility, activities of daily living skills, cognition and respiratory function.

Cancer program

We offer cancer survivors the coordinated treatment, education and support to help restore or maintain function. This program addresses the wide range of issues patients experience as a result of this disease and its treatment, including but not limited to musculoskeletal and/or neuromuscular disorders, radiation fibrosis, lymphedema, post-surgical pain syndromes and fatigue. Through the program's restorative, transitional and supportive pathways, we work to optimize the individual's quality of life, focusing on strength, endurance, balance, mobility, functional abilities, memory and concentration, speech and swallowing, pain management, fatigue and lymphedema reduction.

Cardiac recovery program

The cardiac recovery program is for individuals who have undergone recent cardiac surgery, including coronary artery bypass, valve replacement, aortic aneurysm repair, LVAD placement or heart transplant. It is designed to help patients manage the healing process and regain the strength, skills and strategies needed to return home safely. An interdisciplinary team of medical rehabilitation specialists, as well as consulting cardiologists, pulmonologists and others as needed, coordinate care and provide the education and support to patients and caregivers.
